TITLE: Casting composition of aromatic polyvinyl monomer, polythiol and epoxy strain reducer

Brief Summary Text (2):

The most widely used plastic ophthalmic lens material is polymerised diethylene glycol bis (allyl carbonate). This polymer has proved a satisfactory material for the manufacture of ophthalmic lenses because of a combination of features, including excellent transmission, resistance to discolouration, high strength and high impact resistance. The material has a reasonable abrasion resistance and can be coated to improve that resistance.

Brief Summary Text (36):

The high index bisphenol monomer component in the cross-linkable casting composition when present may be selected from: dimethacrylate and diacrylate esters of bisphenol A; dimethacrylate and diacrylate esters of 4,4'-bishydroxy-ethoxy-bisphenol A and the like.

Brief Summary Text (40):

Suitable materials falling within this definition include materials supplied under the trade names U-4H, U-4HA and U-6HA by Shin Nakamura, NF-201 and NF-202 by Mitsubishi Rayon. U-6HA is preferred. These monomers may be included to improve physical toughness without causing the lens material to become too brittle. Impact resistance is improved without adversely affecting abrasion resistance.

Detailed Description Text (11):

Apparatus used to assess the abrasion resistance of lens materials. It involves the use of an abrasive wheel rubbed across a lens surface. Degree of abrasion is assessed according to the level of haze induced by wear.

Detailed Description Text (13):

Measure of the deflection of a lens material when subjected to a specified force at a fixed temperature.

Detailed Description Text (15):

Measure of the hardness of a lens material. A fixed force is applied to a needle point. The depth of penetration indicates the degree of hardness.

Detailed Description Paragraph Table (2):

CLAIMS:

16. A cross-linkable polymeric casting composition according to claim 11, wherein the
polymerisable comonomer is a high index bisphenol monomer selected from the group
consisting of dimethacrylate and diacrylate esters of bisphenol A, dimethacrylate and
diacrylate esters of 4,4'-bishydroxy-ethoxy-bisphenol A.

TITLE: High index/high abbe number composition

Brief Summary Text (2):

The most widely used plastic ophthalmic lens material is polymerised diethylene glycol bis (allyl carbonate). This polymer has proved a satisfactory material for the manufacture of ophthalmic lenses because of a combination of features, including excellent transmission, resistance to discolouration, high strength and high impact resistance. The material has a reasonable abrasion resistance and can be coated to improve that resistance.

Brief Summary Text (19):

By the term "Abbe number", as used herein, we mean the number expressing the extent to which the shorter and longer wavelengths of light are separated by refraction through a lens, that is the amount the lens disperses the various colours. The greater the number, the smaller the dispersion. The Abbe number may be calculated utilising the following formula: ##EQU1##

Brief Summary Text (95):

The high index bisphenol monomer component in the cross-linkable casting composition when present may be selected from: dimethacrylate and diacrylate esters of bisphenol A; dimethacrylate and diacrylate esters of 4,4'-bishydroxy-ethoxy-bisphenol A and the like.

Detailed Description Text (4):

The casting material was used to fill the space between a pair of glass moulds separated by a plastic gasket at their periphery and held together by a clip. Cure time was 8 hours with heating at a temperature of 40 to 120.degree. C. A satisfactory lens having a high Abbe number of 42 and high refractive index was formed.

TITLE: Process for the manufacture of moldings

Brief Summary Text (54):

A further group of suitable crosslinkers which may be used in the process of the invention are low molecular weight di- or polyvinyl crosslinking agents such as allyl (meth)acrylate, a C.sub.2 -C.sub.8 -alkylene diacrylate or dimethacrylate, divinyl ether, divinyl sulfone, di- and trivinylbenzene, trimethylolpropane triacrylate or trimethacrylate, pentaerythritol tetraacrylate or tetramethacrylate, bisphenol A diacrylate or dimethacrylate, methylene bisacrylamide or -bismethacrylamide, ethylene bisacrylamide or ethylene bismethacrylamide, triallyl phthalate, diallyl phthalate, or a compound of the formula

Brief Summary Text (124):

A further embodiment of the invention relates to the use of the non-porous or porous polymers obtainable by the processes of the invention for the manufacture of moldings, in particular biomedical moldings in both ophthalmic and non-ophthalmic applications. Suitable moldings are, for example, biomedical devices, e.g. ophthalmic devices such as contact lenses, intraocular lenses or artificial cornea comprising a polymer of the invention. Preferred moldings of the invention are those obtainable by the above outlined process for the preparation of porous polymers.

Brief Summary Text (129):

The polymers obtainable according to the processes of the invention, whether non-porous or preferably porous, are capable of interacting with human or animal tissue cells and are thus particularly useful as materials for the attachment and growth of human or animal cells in vivo or in vitro, medical implants (such as implantable semipermeable membrane materials, tissue implants in cosmetic surgery, implants containing hormone secreting cells such as pancreatic islet cells, breast implants, artificial joints, and the like), in artificial organs, tissue culture apparatus (such as bottles, trays, dishes and the like), in biological reactors (such as those used in the production of valuable proteins and other components by cell culture), as material for the fabrication of medical devices or as coating for biomedical or biomaterial devices or applications, such as coatings on vascular grafts, catheters, artificial pancreas and the like, or as material for ophthalmic devices, such as contact lenses, intraocular lenses or artificial cornea, or ocular prostheses, such as corneal implants.

Detailed Description Text (18):

The donor and receiving chamber are connected by a lens holder which is especially designed for sealing a lens thereto, so that the donor solution does not pass around the lens (i.e., proteins may only pass through the lens). Proteins are diffusing through the lens into the receiving chamber on a concentration gradient. Small samples were taken every 20 minutes from the circulating system connected to the receiving chamber and injected in the size exclusion column. The increase of the concentration of the proteins with time gives the MPPT diffusion coefficient D.sub.mppt by applying the following formula:

Detailed Description Text (21):

n' =rate of proteins transport [mol/min]; A=area of lens exposed [mm.sup.2];

Detailed Description Text (22):

Δc =concentration difference [mol/L]; d=thickness of the lens [mm];

Detailed Description Text (23):

The following Table shows diffusion coefficients obtained by this method for a lens

" obtained according to Example 1 and for different commercial membranes. The pore size varies from 15 to 100 nm. The diffusion coefficient of immunoglobulin and serum albumin in the cornea is 0.00042 and 0.00014 mm²/min. taken from D. M. Maurice, P. G. Watson, Exp. Eye Res. (1965), 355-363, M. Allansmith, A. de Ramus, D. Maurice, Assoc. for Res. in Vis. and Ophthal., Inc. (1979) 18, 947-955.

Detailed Description Text (30):

The oxygen permeability of the material according to Example 1 is determined by the coulometric method. The lenticules are clamped in a holder and the upper side of the lenticule is covered with a 2 cm layer of water. A gas mixture comprising 21% of oxygen and 79% of nitrogen is passed continuously through the water layer with swirling. The oxygen which diffuses through the lenticule is measured using a coulometric detector. The reference values are those measured on commercially available contact lenticules applying this method. Cibasoft.RTM. (CibaVision, HEMA lens) shows a values of approx. 7-10 barrer Excelens.RTM. (CibaVision, PVA lens) 22 barrer. The value obtained for the lenticules of Example 1 is 105 barrer.

Detailed Description Paragraph Table (2):

TITLE: Cross-linkable polymeric composition

Brief Summary Text (1):

The present invention relates to the manufacture of plastic optical articles such as video discs and ophthalmic lenses. The most widely used plastic ophthalmic lens material is polymerised diethylene glycol bis (allyl carbonate). This polymer has proved a satisfactory material for the manufacture of ophthalmic lenses because of a combination of features, including excellent transmission, resistance to discolouration, high strength and high impact resistance. The material has a reasonable abrasion resistance and can be coated to improve that resistance.

Brief Summary Text (26):

The high index bisphenol monomer component in the cross-linkable casting composition may be selected from: dimethacrylate and diacrylate esters of bisphenol A; dimethacrylate and diacrylate esters of 4,4'-bishydroxyethoxy-bisphenol A and the like.

Brief Summary Text (29):

As stated above, the cross-linkable polymeric casting composition may include a urethane monomer having 2 to 6 terminal acrylic and/or methacrylic groups. Suitable materials falling within this definition include materials supplied under the trade names U-4H, U-4HA and U-6HA by Shin Nakamura, NF-201 and NF-202 by Mitsubishi Rayon. These monomers are included to improve physical toughness without causing the lens material to become too brittle. Impact resistance is improved without adversely affecting abrasion resistance.

Brief Summary Text (55):

One source we have found satisfactory is a 10 inch, 300 watt/inch mercury lamp. The mould assembly is then heated to 100.degree. C. for one hour or the lens may be removed from the assembly and heated in air for about one hour at 100.degree. C. This means that fully cured lenses can be manufactured, if desired, in about one hour. Heat curing can also be used without any use of U.V. radiation.

Brief Summary Text (113):

In a further aspect of the present invention there is provided a polymeric article formed from a cross linkable casting composition as described above. The polymeric article may be an optical article. The optical article may provide characteristics equal to or greater than those achievable with articles made from diethylene glycol bis(allyl carbonate) but with a considerably reduced cure time and substantially increased throughput. The optical article may be further characterised by having an increased refractive index without degrading other important lens properties such as density, abrasion, impact, colour, and rigidity (hardness and heat resistance).

Detailed Description Text (9):

Apparatus used to assess the abrasion resistance of lens materials. It involves the use of an abrasive wheel rubbed across a lens surface. Degree of abrasion is assessed according to the level of haze induced by wear.

Detailed Description Text (11):

Measure of the hardness of a lens material. A fixed force is applied to a needle point. The depth of penetration indicates the degree of hardness.

CLAIMS:

1. A cross-linkable polymeric casting composition suitable for use in the formation of

a transparent optical article having a high refractive index in the range of 1.55 to 1.60 comprising:

approximately 5% to 30% by weight based on the total weight of the casting composition of a fluorene diacrylate or dimethacrylate monomer selected from monomers of the general formula ##STR14## wherein R.sub.1 =H or alkyl,

R.sub.2 =H or alkyl,

X=H or OH, and

m and n are integers provided that the sum of m and n is from 0 to 4; approximately

5% to 60% by weight of a polyoxyalkylene glycol diacrylate or dimethacrylate; and

at least one comonomer selected from the group consisting of approximately 2.5% to 25% by weight of a urethane monomer having 2 to 6 terminal acrylic and/or methacrylic groups; approximately 5 to 45% by weight of a polyfunctional unsaturated cross-linking agent selected from the group consisting of tri- and tetra-functional vinyls, and acrylic and methacrylic monomers; approximately 10 to 60% by weight of a bisphenol monomer selected from the group consisting of dimethacrylate and diacrylate esters of bisphenol A, dimethacrylate and diacrylate esters of 4,4'-bishydroxy-ethoxy-bisphenol A and mixtures thereof; and approximately 5 to 40% by weight of a thiodiacrylate or thiodimethacrylate; or mixtures thereof.
